

ABSTRACT

A print order management system comprises a display for displaying data and prompt information to a user. A data receiver receives, in use, data from a user relating to the desire for the user to obtain information with respect to a print material supplier, or the nature of a print material. A memory stores, in an associated manner, data related at least to the nature of one or more types of print material and one or more suppliers, and a display data generator generates, based upon the input of the user and the data stored in the memory display data representing information to be provided to a user and providing it to the display.
